TITLE: A Portable Accelerating Tube Incorporating an Ion
Source for a Neutron Generator

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No.1, pp 129-130

TEXT: The accelerating tube has been developed for a small-size neutron generator which will replace the Po-Be neutron source used in oil and gas well sampling by the Leningradskiy filial, Vsesoyuznyy nauchno-issledovatel'skiy institut geofizicheskikh metodov razvedki (Leningrad Branch, All-Union Scientific Research Institute of Geophysical Exploration Methods). The accelerating tube is illustrated schematically in the figure. The neutrons are produced as a result of the D + T reaction. accelerated deuteron ions bombard a zirconium-tritium target of a standard type. In order to maintain the pressure in the tube at the required level, a system of getters and pumps is employed. The ion tube is of the arc type and consists of a cylindrical anode and two disc cathodes. The cathode facing the target has Card 1/4

A Portable Accelerating Tube Incorporating an Ion Source for a Neutron Generator

an aperture through which positive ions are extracted. The magnetic field which is necessary to focus the ionizing electrons can be produced either by a permanent magnet or a solenoid. If a steel body is used, an electromagnet is preferable. A target is located in a massive copper holder so that the instrument can be used without forced cooling for a minimum of 5 to 6 hours. A special electrode in the form of a truncated cone is mounted on the target holder and prevents the occurrence of an avalanche discharge. The negative potential of this electrode is obtained by means of a bias resistor. The deuterium is stored in a special getter as indicated. The getter is made of titanium, or a mixture of zirconium and titanium. The deuterium is re-emitted when the getter is heated. It is re-absorbed when the getter is cooled down. The tube has the following characteristics: length 350-400 mm, diameter 35-40 mm, weight 500 g, maximum external pressure 15 atm, deuterium-store heating current 0.3-0.8 A, anode voltage in the ion gun

400 to 1000 V, magnetic field strength 600 oe, maximum accelerating voltage 70-110 kV. Three times as many neutrons can be obtained with this tube as with a Po-Be source. With a current at the target of 80 μ A, and an accelerating voltage of 110 kV, the neutron yield was 450 curie (\pm 30%).

TITLE: Special tubes for the portable equipment for x-ray spectral analysis

SOURCE: Ref. zh. Metrologiya i izmeritel'naya tekhnika, Abs. 12. 32. 930

REF SOURCE: Sb. Geofiz. priborostr. Vyp. 22. L., Nedra, 1965, 81-87

TOPIC TAGS: x ray emission, x ray measurement, x ray spectrum, x ray spectroscopy, spectrum analysis, x ray tube, portable x ray equipment

ABSTRACT: The drawbacks and limitations of x-ray radiometric analysis with the use of type T¹⁷⁰ or BaCl₄O₃ γ -quantum isotope sources are pointed out. In developing dispersionless field spectrometers, the use of special x-ray tubes makes it possible to increase emission efficiency considerably, to provide for radiation measurement safety while simplifying protection by the absence of the hard-emission component and to alter the spectral composition of the emission either by replacing the plates or by using secondary emitters. Examples of

using tubes with various methods of excitation in assaying rock specimens for zinc and lead are presented. A technical description of BSV-5 and BSV-7 tubes designed for structural analysis is given, and considerations concerning their use in x-ray radiometric analyses are proposed. Basic specifications for special tubes of portable field x-ray radiometric equipment are established, and ways of developing them are outlined. [Translation of abstract] [DW]

TITLE: Purification of heavy fuel oil //

SOURCE: Rechnoy transport, no. 5, 1966, 32-33

TOPIC TAGS: marine engineering, diesel engine, diesel fuel, fuel oil, fuel refining / DT-1 fuel oil, 4Ch17.5-24 diesel engine

ABSTRACT: The authors describe a method proposed for purification of heavy oils of DT-1 trademark used for marine diesel engines by the Irtysh Steamship Agency. The method is proposed on the basis of the experiments conducted by the authors with a 100-hp, 750-rpm diesel engine of 4Ch17.5/24 type. The investigated DT-1 fuel had a viscosity of 2.1 degrees Engler at 50 C and contained 0.1% of solid residues, 0.06% of water and 2.5% of sulfur. A special system shown in a diagram was used for straining the fuel through a filter, for running it through a centrifuge and for separating impurities in a separator. The results of experimental filtering, centrifuging and separating are summed up in a table. The oil was preheated before testing by means of an electric heater placed in the oil tank. The influence of temperature on the elimination of solid residues is plotted in curves for three types of purification. In conclusion, a following method of purifica-

UDC: 662.75.62-73

Card 1/2

L 09318-67

ACC NR: AP6028055

tion is proposed. First, the oil is clarified by settling in fuel tanks at temperatures of 40 to 50 C. Then, water and residues are separated in a separator. Finally, a further elimination of solid particles takes place in a centrifuge. A temperature of 60 to 70 C is recommended for separators and centrifuges. Orig. art. has: 2 diagrams, 1 table.

PERIODICAL: Radio, 1958, Nr 9, p 53 (USSR)

ABSTRACT: The receiver is a 2-V-3 straight amplification set using junction-type transistor triodes and a germanium diode for the detector. It picks up stations between 700 and 1,800 m on a built-in ferrite antenna. Power is supplied from 3 cells of an FBS-0.25 battery and a microphone inset used for the loudspeaker. Miniature components are used throughout, and the dimensions of the plastic case in which the receiver is assembled are 28 x 63 x 100 mm.

TITLE: The use of an analog computer to calculate the initial conditions for a system
in an optimal motion control problem *q*

SOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 6, no. 2,
1966, 386-389

TOPIC TAGS: optimal control, optimal automatic control, time optimal control, control
theory, motion equation, analog computer, computer application, computer simulation

ABSTRACT: The authors describe analog computer simulation of a simple motion equation
with the objective of finding the optimum control parameters of a system. The work was
designed to prove the feasibility of using analog computers in the solution of optimi-
zation problems of this type. Consider the motion of a point m (figure 1) in a force
field. The point is acted upon by the field and by a constant magnitude pulling force.
The equation of motion may be written as

$$\frac{d^2r}{dt^2} = -\frac{1}{r^2} r + a$$

UDC: 518.51:62-50

Card 1/3

L 05697-67

ACC NR: AP6011364

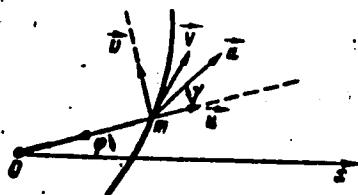

Fig. 1.

or in the radial and transverse projections as

$$\dot{t} = u, \quad \dot{\phi} = \frac{v}{r}, \quad \dot{r} = \frac{v^2 + 1}{r} - \frac{a^2}{r^2} + a \cos \gamma, \quad \dot{s} = -\frac{av}{r} + a \sin \gamma, \quad (1)$$

where r is the polar radius of the point, ϕ is the polar angle, a is the pulling force modulus, u and v are radial and transverse velocity components and γ is the angle formed by the direction of the pulling force and the polar radius. The problem is to find an optimum control $\gamma = \gamma(t)$ which will transfer the point m in a minimum of time from the position

r_0, ϕ_0, u_0, v_0 , where $t = 0$

into position r_f, ϕ_f, u_f, v_f , where $t = t_f$.

Applying Pontryagin's maximum principle, this problem can be reduced to the solution

Card 2/3

L 05697-67

ACC NR: AP6011364

of a two-point boundary problem. Since the system (1) is unstable in this particular case, to ensure the stability of the system simulated on the analog computer, the original system (1) is transformed by substitution of

$$\rho = \frac{1}{r}, \quad s = \frac{dp}{d\varphi}, \quad \omega = \frac{1}{r^2 \varphi^2}$$

into

$$p' = s, \quad s' = \omega - p - \frac{\alpha \omega \cos \gamma}{\rho^2} - \frac{\alpha \omega \sin \gamma}{\rho^3}, \quad \omega' = -2 \frac{\alpha \omega^2 \sin \gamma}{\rho^3}.$$

Hence the problem amounts to finding of optimal control, which transfers the point m from the position (p_0, s_0, ω_0) where $\varphi = 0$

for $\varphi=0$ into position

(p_1, s_1, ω_1) where $\varphi = \varphi_1$

and the minimizing functional

$$I = \int \frac{1}{\rho^2} d\varphi.$$

The authors set up the necessary equations and provide a block diagram for system simulation on an analog computer. The feasibility of solving problems of this type on an analog computer is proven and an example is included. Orig. art. has: 10 formulas, 3 figures.

ABSTRACT" An Author Certificate has been issued for a stand for testing tractors, which includes a frame, braking units, rails, a wheeled carriage with supports, and tension members. In order to decrease carriage vibration and noise during the tractor tests, the axles of the carriage wheels, which are mounted in stirrups, are articulately fastened to the frame; at the other end they are connected by a nut which interacts with the supporting screw. In a variant, on the lower part of the carriage frame are mounted female guide rails and fixing brackets with clamping screws. Orig. art. has: 1 figure.

TITLE: Relative locations of the ($\pi\pi^*$) and ($\pi\pi^*$) states of molecules and their optical properties. I. Influence of the length of the chain of conjugate bonds on the relative position of the ($\pi\pi^*$) and ($\pi\pi^*$) states

SOURCE: Optika i spektroskopiya, v. 20, no. 4, 1966, 589-593

TOPIC TAGS: excited state, ground state, molecular spectrum, conjugate bond system, molecular orbital

ABSTRACT: The author investigates the dependence of the relative position of the ($\pi\pi^*$) and ($\pi\pi^*$) excited states (relative to the energy of the ground state of the molecules) in molecules with conjugate bonds, as a function of the length of the conjugate-bond chain. The analysis is confined to a molecule of the type $R=CH-(CH=CH)_m$, containing a certain atom with n-electrons (such as oxygen or NH) and a chain of conjugate bonds. An approximate molecular-orbital method is used for the calculations. It is shown that the luminescence properties of such molecules depend on the length of the chain. If the chain is sufficiently long,

Card 1/2

UDC: 539.194

L 31504-66

ACC NR: AP6013020

the order of the arrangement of the ($\pi\pi^*$) and ($n\pi^*$) states may become reversed, and this may make it possible to observe energy migration from the singlet ($n\pi^*$) state to the singlet ($\pi\pi^*$) state. The author thanks N. A. Prilezhayeva for a discussion of the results. Orig. art. has: 1 figure and 16 formulas.

TITLE: Quantum mechanical calculation of molecules. Theory of generalized combined orbits

SOURCE: IVUZ. Fizika, no. 1, 1966, 107-110

TOPIC TAGS: molecular property, crystal property, benzene, nitrobenzene

ABSTRACT: To get around some of the difficulties involved in the use of the molecular orbital method in the form of a linear combination of atomic orbitals with variable coefficients, the author makes use of the method of combined orbitals, proposed by P. O. Lowdin (J. Chem. Phys. v. 19, 1470, 1951) for the calculation of the energy of crystals.² This method is modified to be applicable to molecules and to accommodate integral equations with more than two kernels. The method is used to calculate the molecules of benzene, diphenyl, and nitrobenzene and yields results which agree well with experiment. The author thanks N. A. Prilezhayeva, V. I. Danilova, and O. A. Ponomarev for numerous discussions, and also L. G. Turovetz for calculations. Orig. art. has: 1 figure, 13 formulas, and 1 table.

1

SOURCE: Vestnik svyazi, no. 3, 1965, 10-11

TOPIC TAGS: clutch, electromagnetic clutch, contactless clutch

ABSTRACT: A new design of a contactless electric brake-clutch intended for tuning mechanisms of radio transmitters is briefly described. The distinguishing features of the new clutch are: the drive friction disk is located outside the magnetic circuit which makes their sizes independent; the engage-disengage disk-and-shaft member is made from a nonmagnetic material which reduces magnetic leakage and clutch size; only one airgap in the magnetic circuit. A model clutch 40-mm diameter and 35-mm long was successfully tested and developed a

temperature rise of 40C. Orig. art. has: 1 figure.

DC generators very frequently possesses de-stabilizing factors which cause fluctuations in the generated voltage. Especially important to overcome this unstable characteristic, when these machines are used to supply power to filaments (of tubes, etc.). Discusses carbon regulator developed at one of the broadcasting stations which greatly stabilizes this current and makes it possible to use DC generators very effectively for supplying power to filaments.

TITLE: Use of photodissociation processes and complex formation for production of level population inversion

SOURCE: Optika i spektroskopiya, v. 18, no. 1, 1965, 156-158

TOPIC TAGS: photodissociation, complex formation, phenol, aromatic acid, aromatic amine, nitrogen organic compound, frequency shift, absorption band

ABSTRACT: Following up the work by M. G. Kuz'min (DAN SSSR v. 151, 1371, 1963) and A. N. Orayevskiy (ZhETF v. 45, 171, 1963), who showed that population-level inversion can be attained in principle in photochemical and chemical reactions, and pointing out that there are no theoretical and few experimental data on the subject, the authors suggest a theoretical approach, based on simple examples in which they consider electrolytic dissociation of some phenols and aromatic acids, and also complex formation of aromatic amines and nitrogen compounds. An equation is derived for the ratio K^*/K of the equilibrium constants in the excited

Cord 1/2

L 25373-65
ACCESSION NR: AP5003041

and ground states, for phenol, orthonitrophenol, benzoic acid and the complexes aniline-nitrobenzene, aniline-trinitrobenzene, trinitrobenzene-p-xylidine, trinitrobenzene-mesidine, and 4,4-dinitrodiphenolbenzidine. In the case of phenol, orthonitrophenol, and benzoic acid, the values of K^*/K are $10^{4.6}$, $10^{5.5}$, and $10^{4.9}$ respectively, so that the condition $K^*/K \geq 10^5$ for level inversion, derived by Orayevskiy, may or may not be satisfied. The values of K^*/K for the complexes are well above this limit. "We thank M. A. Prileayeva and the members of the Spectroscopy Laboratory for a fruitful discussion." TITLE: Co-Precipitation of Small Amounts of Selenium With Ferric Hydroxide (Soosazhdeniye malykh kolichestv selena s gidrookis'yu zheleza)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1958, Vol. 3, Nr 8,
pp. 1761-1766 (USSR)

ABSTRACT: This paper describes the investigation of the co-precipitation of selenium with iron-(III)-hydroxide in dependence upon various factors, such as the pH value of the solution, the concentration of the ammonium salts, the concentration of selenium, the amount of ferric hydroxide, the temperature of the solution, the consecutive order of the mixing of components and the length of storage of the solution with ferric hydroxide. For the investigation of the co-precipitation of selenium, radioactive selenium Se⁷⁵ in the form of selenious and selenic acid was used. It was found that the concentration of ammonium nitrate in the range 0,05 - 0,5 N does not affect the co-precipitation of selenium. It becomes evident that selenium is co-precipitated almost perfectly up to pH = 8. With increasing

Card 1/3

Co-precipitation of Small Amounts of Selenium
With Ferric Hydroxide

SOV/78-3-8-6/48

content of selenium in the sample the relative percentage co-precipitation is reduced. With increasing amount of ferric hydroxide the co-precipitation of selenium practically does not change, not even with a tenfold amount of ferric hydroxide. At pH = 8 the amount of the co-precipitated selenium decreases if the temperature increases. Preservation of the precipitate in the solution diminishes the amount of the co-precipitated selenium, since the desorption of selenium increases with an aging of the ferric hydroxide. Tetravalent selenium precipitates more than the hexavalent one. In solutions which contain selenium-(VI), in particular in copper ores, a part of the selenium remains dissolved as Se-(VI). There are 8 figures and 9 references, 9 of which are Soviet.

TITLE:

The Determination of Silver in Alloys by the Method of
Radiometric Titration (Opredeleniye serebra v splavakh metodom
radiometricheskogo titrovaniya)

PERIODICAL:

Zavodskaya Laboratoriya, 1958, Vol. 24, Nr 8,
pp. 927 - 928 (USSR)

ABSTRACT:

The possibility of applying the method of radiometric titration to the determination of silver in copper and lead alloys was investigated. The titration equipment was constructed according to a diagram given in the literature. An instrument of the type AC-1 which was connected to a B-1 radiometer was used as an impulse counter. The solution in which the activity was determined had a volume of 25 ml. The titration of the nitric acid solution of silver was carried out using 0,005 N and 0,1 N solutions of hydrochloric acid. The silver isotope Ag¹¹⁰ was used as the radioactive indicator. The initial activity did not exceed 2500 impulses per minute. The equivalence point was determined graphically. The results are given in tables. The determinations of silver in solutions

TITLE:

Application of Iron Hydroxide for the Separation of Tetra-valent and Hexavalent Selenium (Primeneniye gidrookisi zheleza dlya razdeleniya chetyrekh- i shestivalentnogo selena)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 6,
pp 666 - 668 (USSR)

ABSTRACT:

A method was introduced, to be applied for the separation of small amounts of selenite- and selenate ions. It is based on the co-precipitation of the selenite ion with iron hydroxide at pH 8.4 - 8.6. Under these conditions the selenate ion is not co-precipitated. The completeness of the precipitation was checked by the aid of Se⁷⁵, and the activity of the solutions was measured with a counter of the MS-7 type at the radiometer B-2. Two experimental series were carried out - selenic acid was marked in the one, and the selenous acid in the other. In the second experimental series the hydroxide precipitate was solved in nitric acid and the activity was measured after the first precipitation. Measuring results revealed (Table 1) that a second precipitation must

Card 1/2

Application of Iron Hydroxide for the Separation of SOV/32-25-6-8/53
Tetravalent and Hexavalent Selenium

be carried out by all means, as had been also stated in (Ref 5) concerning the selenium separation from copper. The behavior of Se^{6+} in the separation of the selenite ion with the iron hydroxide precipitate is mentioned (Table 2), and it is stated that also in the second precipitation the selenate ion remains in solution. There are 2 tables and 5 references, 4 of which are Soviet.

TITLE: Co-precipitation of indium with sulfides of some metals in sulfide-alkaline media

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1963, 15, abstract 2K84 ("Sb. tr. Vses. n.-i. gornometallurg. in-t tsvetn. met.", 1962, no. 7, 289 - 295)

TEXT: To a solution containing In chlorides and the solution of another test metal, an excess of the Na₂S solution was added and filled up with water up to 100 ml. The mixture was stirred at a speed of 250 rpm, the precipitate was separated by centrifuging. The amount of In remaining in the solid phase was calculated from the radioactive aliquot portion of the solution. An In¹¹⁴ radio-isotope was used. It was established that in the Na₂S solution at a concentration as high as 1 n. and more, In is fully transferred into the solution. In the presence of Cu, Cd and Zn, considerable co-precipitation of In with sulfides of these metals takes place. If the Zn content exceeds the In content, the latter

Card 1/2

Co-precipitation of indium with...

S/137/63/000/002/034/034
A006/A101

is fully precipitated. A compound of composition $In_2S_3 \cdot 4ZnS$ is formed. With higher In concentration in the solution, the solubility of Cu and Cd sulfides in the Na_2S solution increases. In the joint presence of Fe and In in the solution, full Fe precipitation takes place if Na_2S solution is added, and In remains in the solution. This can be used for the separation of Fe and In. Sn as well as In do not co-precipitate with Fe_2S_3 . Experiments were made on the precipitation of Sn with ZnS. It is shown that in the presence of ZnS, Sn and In can not be separated with the aid of Na_2S .

On the Differentiability of the Solutions of Variation Problems
for Non-Parameter Representation (O differentsiruemosti resheniy
variatsionnykh zadach v neparametricheskoy forme)

PERIODICAL: Doklady Akad.Nauk SSSR, 1957, Vol.116, Nr.5, pp.746-749 (USSR)**ABSTRACT:** Let G be a bounded twodimensional domain with a uniformly regular boundary [Ref.7]. Let $F(x,y,z,p,q)$ be defined and continuous in G and for arbitrary z,p,q let it satisfy the conditions:

1. $F_{pp} F_{qq} - F_{pq}^2 > 0$, $F_{pp} > 0$ in G ; 2. for $\sqrt{p^2+q^2} \equiv R \geq \Delta > 0$
there holds the decomposition $F \equiv f(x,y,z) \cdot F^{(1)}(p,q) + F^{(2)}(x,y,z,p,q)$,
where $f > 0$, $F^{(1)}$ and $F^{(2)}$ are differentiable four times;
3. $F^{(1)}(p,q)$ is positive-homogeneous of degree $\alpha \geq 2$ in p,q and
we have $F_{pp} F_{qq} - F_{pq}^2 \geq L > 0$ for $p^2+q^2 = 1$, where L does not
depend on p,q ;
4. $\left| \frac{\partial^\beta F^{(2)}(x,y,z,p,q)}{\partial p^m \partial q^n \partial z^k \partial x^l \partial y^s} \right| \leq L_1 R^{d-\gamma-m-n}$, $m+n+k+l+s=\beta$, $\beta=0,1,2,3,4$,

Card 1/2

On the Differentiability of the Solutions of Variation Problems
for Non-Parameter Representation 20-5-8/48

$$(x,y) \in G; |z| < z_0; L_1 = L_1(z_0) > 0; \gamma > 0; \sqrt{p^2+q^2} \geq \Delta .$$

Theorem: Let \mathbb{A}^2 be the class of functions continuous according to Tonelli with the finite Dirichlet integral $D(z) = \iint_G (zx^2 + zy^2) dx dy$.

Let $z_0(x,y) \in \mathbb{A}^2$. Let the function F satisfy the conditions 1.-4.
and let it imply a minimum of the integral

$$\iint_G F(x,y,z,p,q) dx dy, \quad p=zx, \quad q=zy$$

for given values on the boundary of G . Let the solution $z_0(x,y)$
be unique in the small. Then $z_0(x,y)$ in every domain G_1 , $\overline{G}_1 \subset G$,
satisfies the Lipschitz condition and consequently: if $F \in C^{(2)}$

Card 2/2 (analytical), then also $z_0(x,y) \in C^{(2)}$ (analytical) in G_1 . Six Soviet
and 4 foreign references are quoted.

TITLE: Generalized-Saddle-Shaped Functions (Obobshchenno-sedloobraznyye funktsii)

PERIODICAL: Uspekhi matematicheskikh nauk, 1958, Vol 13, Nr 5, pp 191-196 (USSR)

ABSTRACT: Let G be a two-dimensional domain. A continuous function $z(x,y)$, $(x,y) \in G$ is called R-generalized-saddle-shaped ($R > 0$) if for every domain $D \subset G$ and arbitrary a and b, $a^2+b^2 \geq R^2$, the function $z(x,y)-ax-by$ reaches its maximal and its minimal value on the boundary of D.

The author proves the following generalization of a lemma due to Lebesgue-Radó: Let $z(x,y)$ be an R-generalized-saddle-shaped function defined in the circle $K: x^2+y^2 \leq 1$ and satisfying the Lipschitz condition with the constant L on the boundary of K.

Then in every circle $K^\delta: x^2+y^2 \leq \delta^2 < 1$, $z(x,y)$ satisfies the Lipschitz condition with a constant L_1 depending only on L, δ and R.

On the Differentiability of the Solutions of Regular Variational Problems in Nonparametric Form (O different-siruyemosti resheniy regulyarnykh variatsionnykh zadach v neparametricheskoy forme)

PERIODICAL: Matematicheskiy sbornik, 1959, Vol 47, Nr 3, pp 355-396 (USSR)

ABSTRACT: Let the minimum of the integral $\int_G F(x,y,z,p,q)dx dy$ be

sought. When does the absolutely continuous solution of such a regular problem satisfy the Lipschitz condition? Fundamental theorem: Let $F(x,y,z,p,q)$ together with its five first derivatives be defined and continuous in the bounded two-dimensional domain \bar{G} . Let $F_{pp} > 0$, $F_{pp} \cdot F_{qq} - F_{pq}^2 > 0$. For all $(x,y) \in \bar{G}$ and arbitrary z,p,q let $F(x,y,z,p,q) = f(x,y,z)F^{(1)}(p,q) + F^{(2)}(x,y,z,p,q)$. Let $f(x,y,z) > 0$ be in \bar{G} . Let $F^{(1)}(p,q)$ be homogeneous of the order $\sigma \geq 2$; $F_{pp}^{(1)} \cdot F_{qq}^{(1)} - (F_{pq}^{(1)})^2 > 0$,

SOV/39-47-3-4/4

$x = x_c$). Under these assumptions $z_c(x,y)$ belongs to the class
 C^3 ; if F is analytic, then $z_c(x,y)$ is analytic too.

The proof of the theorem is based on the construction of a
sequence F_n approximating the function F , where the F_n for

$p^2 + q^2 \geq R_n^2$, $R_n \rightarrow \infty$ do not depend on x, y, z . Then the author
considers the corresponding solutions $z_n(x,y)$ which satisfy a
Lipschitz condition independent of n and which approximate
the solution $z(x,y)$. A result of A.G. Sigalov [Ref 67] is used.
The introduction of so-called generalized saddle-shaped
solutions is of essential importance. - There are 18 references,

TITLE: On a problem of the optimal control of steady-state systems with distributed parameters

SOURCE: AN SSSR. Doklady, v. 170, no. 2, 1966, 290-293

TOPIC TAGS: optimal control, linear differential equation, existence theorem, uniqueness theorem

ABSTRACT: The article presents several new existence, switching, and uniqueness theorems of optimal processes described by n-variate linear differential equations of the parabolic type, for the relatively uninvestigated case of systems with distributed parameters. The following optimal control problem is considered: find among all the controls $\bar{\mu}(t) \in D$ a control $\bar{\mu}_0(t) \in D$, which satisfies the functional equality $I_1(\mu_0) = \inf_{\mu \in D} I_1(\mu)$ or $I_2(\mu_0) = \inf_{\mu \in D} I_2(\mu)$

where $0 \leq t \leq T$; T is fixed. For the case of linear controls the following existence theorem

Card 1/2

ACC NR: AP6032273

is proposed: If $g(p, \mu) = \sum_{j=1}^n g_j(p)\mu_j$, where $g_j(p)$, $p \in \Sigma$ are bounded measurable

functions (Σ is the piecewise-smooth boundary of the n-variate bounded region), if M is the control region -- a convex set of permissible controls forming the functional class D -- and if there exists at least one control $\bar{\mu}(t) \subset D_1$ for which $I_1(\mu) < +\infty$ (or $I_2(\mu) < D$), then there also exists an optimal control realizing $\inf_{\mu \in D} I_1(\mu)$ (or $\inf_{\mu \in D} I_2(\mu)$). Further the necessary optimality criterion is formulated: If $\mu_0(t)$ optimal, then

$$\inf_{\mu \in M} \sum_{j=1}^n \Phi_j(\tau) \mu_j = \sum_{j=1}^n \Phi_j(\tau) \mu_{0j}(\tau) \quad (1)$$

and on this basis, switching and uniqueness theorems characterizing the properties of the optimal control $\mu_0(t) \in D$ are proved. Orig. art. has: 6 formulas.

TITLE: Coprecipitation of small amounts of selenium and zinc with metal hydroxides

SOURCE: Zhurnal neorg. khim., v. 9, no. 2, 1964, 451-455

TOPIC TAGS: selenium coprecipitation, zinc coprecipitation, selenium adsorption, zinc adsorption, metal selenite, metal hydroxide coprecipitation, coprecipitation mechanism

ABSTRACT: The adsorption isotherms of selenium (IV) on iron hydroxides were constructed. It is suggested that the mechanism of coprecipitation of selenium with metal hydroxides is the formation of difficultly soluble metal selenites which are entrained in the precipitate with the metal hydroxide which acts as the carrier. The coprecipitation of zinc with different metals and its dependence on pH of the solution was investigated: coprecipitation of zinc increases in the following series: $\text{Be}(\text{OH})_2 - \text{In}(\text{OH})_3 - \text{Al}(\text{OH})_3$ 1/2
Card

ACCESSION NR: AP4012449

$\text{Fe(OH)}_3 - \text{Zr(OH)}_4 - \text{Ti(OH)}_4 - \text{Cr(OH)}_3$. Coprecipitation is optimum in all cases at a pH of 7.5-8, coprecipitation with Be(OH)_2 being only about 10% and approaching 100% with Cr(OH)_3 . Orig. art. has: 4 figures, 1 table and 1 equation.
